

Raj Lathigra

Blockchain Developer | Solidity, EVM, Hyperledger Fabric

Vadodara, India | +91 8849880209 | rlathigra11@gmail.com | [Github](#) | [LinkedIn](#) | [Portfolio](#) | [Twitter](#)

SUMMARY

Blockchain engineer with multi-chain protocol experience across EVM (Solidity) and SVM (Rust/Anchor), plus enterprise Hyperledger Fabric systems bridged to Ethereum for cross-chain verification. Background spans smart contract auditing, DeFi mechanics (lending/liquidation, DEX/AMM), and token-sale contract development. Comfortable working across architecture, contract development, and multi-chain deployment. Led a Hyperledger Fabric digitization platform that cut manual paperwork by 60% and certificate turnaround to under 2 minutes.

SKILLS

Smart Contract: Solidity | EVM | Rust/Anchor (SVM) | Hardhat | Foundry | Uniswap V2 | Gas Optimization | Contract Auditing | Hyperledger Fabric | Cross-Chain Bridging | ethers.js | web3.js

Other: JavaScript | TypeScript | Python | C/C++ | Go | React | Next JS | Node.js | MongoDB | Git | Express | Docker | Render | Vercel

WORK EXPERIENCE

Blockchain Developer - JadeQuest Consulting Pvt Ltd

Ahmedabad, India | April 2026 – Present

- Wrote presale/token-sale smart contracts (Solidity/EVM) with whitelist, cap, and distribution logic, and Rust-based contracts for SVM, launching on Base testnet for trial validation ahead of mainnet deployment.
- Led end-to-end development of the TDR (Transfer of Development Rights) digitization platform using Go-based chaincode on Hyperledger Fabric, including public blockchain bridging via Ethereum for cross-chain verification.
- Cut certificate turnaround to under 2 minutes and reduced manual paperwork by 60% through OCR-based certificate generation.
- Co-built the Loan Process and Hawker Portal modules on Hyperledger Fabric, reducing paperwork and process time by 60% on Hawker Portal.
- Co-built an HRMS module with automated payroll, attendance and leave management, and OCR-based onboarding verification, onboarding 26 employees who now use it daily for attendance tracking.

Blockchain Developer - Freelance Developer

Remote | April 2025 – April 2026

- Audited, debugged, and enhanced Solidity smart contracts across 2 client projects using ethers.js and web3.js, writing test cases to improve reliability and security.
- Wrote and refined 3 Solidity smart contracts for NFT and DeFi initiatives, aligning with project-specific requirements.

Business Development Executive Intern - Sirechain

Remote | December 2024 – March 2025

- Analysed and identified potential partnerships, securing new collaborations to enhance the Sirechain ecosystem's outreach and adoption.
- Engaged directly with 4 prospective clients to explore partnership synergies, supporting the Sirechain ecosystem's outreach efforts.

Blockchain Developer Intern - Solulab

Remote | July 2024 – November 2024

- Developed and optimised 10+ Solidity smart contracts, improving contract execution efficiency and reducing gas costs by up to 15%.
- Learned smart contract auditing fundamentals and independently audited 3 contracts, identifying vulnerabilities and improving code quality.

PROJECTS

[Lending Protocol \(Solana / Anchor\)](#)

July 2026

- Built an overcollateralized lending protocol on Solana featuring SOL collateral deposits, LTV-gated borrowing, and voluntary repayment.
- Implemented oracle-driven, permissionless liquidation of underwater positions with a liquidator bonus incentive.

[Decentralized Exchange Platform](#)

September 2024

- Implemented secure token swaps and liquidity provision (Solidity, Uniswap V2, Hardhat, Polygon L2) for seamless end-user transactions.

[Proof of Touch Grass \(Solidity\)](#)

May 2026

- Built an on-chain accountability protocol where users stake USDC against self-reported challenges verified by photo proof (IPFS).
- Designed a permissionless voter pool that stakes USDC to verify claims, with payouts and slashing determined by voting consensus.

[RoomieSplit](#)

September 2025

- Developed a full-stack web app (Rust, Anchor, SVM, React) to simplify expense and rent splitting among roommates, with transparent tracking and automated settlement fully on-chain.

ERC-4626 Inflation Attack (Solidity / Foundry)

July 2026

- Built a Foundry repo demonstrating the ERC-4626 "first depositor" inflation attack against a naive vault.
- Implemented and compared two mitigations: OpenZeppelin's virtual-offset approach and a Uniswap V2-style minimum-deposit with dead-share burn.
- Fuzz-tested both fixes across deposit sizes up to 1e30, asserting the attacker never profits from the exploit.

ACHIEVEMENTS & CONTRIBUTIONS

- Best UI Design, Hackvengers hackathon, for a Web3 game, recognised for innovative and engaging user interface design.
- Selected as a Martian in the BNB Chain Program.

EDUCATION

Bachelor of Technology in Information Technology, Parul Institute of Engineering and Technology

September 2021 – June 2024

Vadodara, India | CGPA: 7.98/10

Diploma in Information Technology, Parul Polytechnic Institute

June 2018 – August 2021

Vadodara, India | CGPA: 9.47/10
